

This pie chart seems very crowded and therefore not the best option to display the total population per state. Also the use of this many colors feels very overwhelming. A fix for these problems could be to use a map where the color of the state indicates the population according to a color gradient. Another possible fix would be to use a dot plot.

HOW BABY BOOMERS DESCRIBE THEMSELVES

This chart again is a bad way of visualizing the data. That is because the way the body is split in parts how people describe themselves and have totally no correlation with what part of the body it is. The feet and lower legs have nothing to do with how creative you are. A better way of visualizing this data would be to use a pie chart where you can see how the boomers are divided. Another way would be to use a barchart.

The use of this scatterplot is maybe not the best way of displaying the data. You can see that the data is very spread out. The way the axes are chosen is wrong. The x-axis should have been the population of the country or maybe the demand, but certainly not the alphabet. Furthermore, Europe seems to be way more represented than other parts of the world, which could result in a wrong conclusion about the continents.
